**Abstract:** In the present work, nano scaled zero valent irons (nZVI) were synthesized from the plant extract of under atmospheric conditions. The obtained iron nanoparticles are mainly in zero valent oxidation state. A systematic characterization of nZVI was performed using UV, XRD and SEM studies. The diameter of iron nanoparticles was predominantly found within the range 50-100 nm.

**Key words:** Zero valent iron • Nanoparticles • Green Synthesis • UV • XRD • Transmission electron microscopy

### INTRODUCTION

“Nano” is derived from the Greek word for dwarf. A nanometer is one billionth of a meter ( $10^{-9}$ ) and might be represented by the length of ten hydrogen atoms lined up in a row [1]. Nanotechnology implies the creation and utilization of materials, devices and systems through the control of matter on the nanometer-length scale i.e. at the level of atoms, molecules and supramolecular structures [2-4]. Nanotechnology is mainly concerned with synthesis of nanoparticles of variable sizes, shapes, chemical compositions and controlled dispersity and their potential use for human benefits. Although chemical and physical methods may successfully produce pure, well-defined nanoparticles, these are quite expensive and potentially dangerous to the environment. Use of biological organisms such as microorganisms, plant extractor plant biomass could be an alternative to chemical and physical methods for the production of nanoparticles in an eco - friendly manner [5-7]. Nanotechnology is a reliable and enabling environment friendly process for the synthesis of nanoscale particles. Nanosize results in specific physicochemical characteristics such as high surface area to volume ratio, which potentially results in high reactivity [8]. Biosynthesis of nanoparticles is a kind of bottom up approach where the main reaction occurring is reduction/oxidation. With the antioxidant or reducing properties of plant extracts, they are usually responsible for the reduction of metal compounds into their respective

nanoparticles. Green synthesis provides advancement over chemical and physical method as it is cost effective, environment friendly, easily scaled up for large scale synthesis and in this method there is no need to use high pressure, energy, temperature and toxic chemicals [9]. Green synthesis offer better manipulation, control over crystal growth and their stabilization. This has motivated an upsurge in research on the synthetic routes that allows better control of shape and size for various nanotechnological applications.

Here in the present work we have reported for the first time the synthesis of green iron nanoparticles using the Seeds extract of the plant – (common name – Coffee). Aqueous Ferric Chloride solution, after reacting with Coffee extract, led to rapid formation of highly stable, crystalline Iron nanoparticles. The rate of nanoparticle synthesis was very high, which justifies use of plants over microorganisms in the biosynthesis of metal nanoparticles through greener and safer methods. In the subsequent sections we have described the synthesis of iron nanoparticles based upon the change in color, change in pH, change in absorbance and the particle size formed after reduction.

### Plant Description:

- Binomial name - *Coffea arabica*
- Common Name – Coffee
- Plant part taken - Seeds
- Family Name - Rubiaceae

Fig. 1: Coffea Arabica (Coffee)

**Description:** Coffee is a genus of flowering plants whose seeds, called coffee beans, are used to make coffee. The caffeine in coffee "beans" is a natural plant defense against herbivory, i.e. a toxic substance that protects the seeds of the plant. Several insect pests affect coffee production, including the coffee borer and the coffee leaf miner. Coffee is used as a food plant by the larvae of some Lepidoptera (butterfly and moth) species.

## MATERIALS AND METHODS

**Reagents and Chemicals:** 0.001 M Ferric Chloride was obtained from Sigma Aldrich. Freshly prepared triple distilled water was used throughout the experiment.

**Collection of Extracts:** Coffee seeds were collected from the local region. They were washed and cleaned with triple distilled water and dried with water absorbent paper. Then it was cut into small pieces with an ethanol sterilized knife and crushed with mortar and pestle dispensed in 10 ml of sterile distilled water and heated for 2-3 minutes at 70-80°C. The extract was then filtered using Whatman's No.1 filter paper. The filtrate was collected in a clean and dried conical flask by standard sterilized filtration method and was stored at 4°C.

**Synthesis of Zero Valent Iron Nanoparticles:** During the synthesis of Iron Nanoparticles both the precursor and the reducing agent were mixed in a clean sterilized flask in 1:1 proportion. For the reduction of Fe ions, 5ml of filtered plant seeds extract was mixed to 5 ml of freshly prepared 0.001 M aqueous of FeCl<sub>3</sub> solution with constant stirring at 50-60°C. Within a particular time change in colour from Brown to Brownish Black color obtained by nanoparticles

synthesis. The Iron Nanoparticles so prepared were stabilized by adding 1% of chitosan and 1% of PVA.

**UV-Vis Spectra Analysis:** The reduction of pure Fe<sup>+3</sup> ions to Fe<sup>0</sup> was monitored by measuring the UV-Vis spectrum by sampling of aliquots (0.3 ml) of Fe Nanoparticle solution diluting the sample in 3 ml distilled water. UV-Vis spectral analysis was done by using UV-Vis spectrophotometer Systronics 118 at the range of 200-600 nm and observed the absorption peaks at 216-268 nm regions due to the excitation of surface plasmon vibrations in the FeNPs solution, which are identical to the characteristics UV-visible spectrum of metallic Iron and it was recorded.

**pH Analysis:** The pH was determined by using Digital pH meter Systronics. The pH of the reduced solution with Nanoparticle synthesized was found to be 2.16.

## RESULT AND DISCUSSION

Coffee Plant seeds extract is used to produce Iron Nanoparticles in this experiment. Fe<sup>+3</sup> ions were reduced into Fe<sup>0</sup> nanoparticles when plant Leaves extract is mixed with FeCl<sub>3</sub> solution in 1:1 ratio. Reduction is followed by an immediate change in color from Brown to Brownish Black and change in pH of the solution. It is well known that Ferric Chloride exhibit bright yellowish color in distilled water. On mixing the plant seeds extract with the aqueous FeCl<sub>3</sub> solution it changed the color of the solution immediately and reducing the pH, which may be an indication of formation iron nanoparticles. In this experiment it was observed that the pH changed from high acidic to low acidic.

Table 1: Change in color of the solution during Iron Nanoparticle synthesis

Sr. No	Solution	Color change		Color intensity	Time
		Before Reduction	After Reduction		
1.	Coffee Plant Seeds Extract	Brown	Brownish Black	+++	24 - 48 hours
2.	0.001 M FeCl <sub>3</sub> Solution	Bright dark yellow			

Color intensity: - += Light color, +++ Dark color, ++++ Very dark color

Table 2: Change in pH during iron nanoparticle synthesis

Plant Extract			Ph change			
Binomial Name	Local name	Plant Part Taken	Before	After	UV range	Result
<i>Coffea arabica</i>	Coffee	Seeds	4.90	2.20	216-265nm	+

Result: - += Positive, -= Negative.

Fig. 3: XRD pattern of Iron Nanoparticles

**UV Visible Spectroscopy and Color Change for the Green Synthesized Iron Nanoparticles:** The UV visible spectroscopies of the synthesized nanoparticles were in the range of 216-265 nm. Black Tea Leaves extract was shown to synthesize the iron nanoparticles by the

Fig. 4: SEM image of Iron Nanoparticles

indication of suitable surface Plasmon resonance (SPR) with high band intensities and peaks under visible spectrum.

**SEM Images of Iron:** The spheres having diameters of around 100 nm can be distinguished from each other and is in agreement with SEM results.

## CONCLUSION

It has been demonstrated that extract is capable of producing iron nanoparticles that shows good stability in solution, under the UV-Visible wavelength nanoparticles shown quiet good surface plasmon resonance behavior. Ferric Chloride with reducing agent i.e. Coffee Plant Seeds extract has shown a remarkable color change with concerned change in pH of solution. Success of such a rapid time scale for synthesis of metallic nanoparticles is an alternative to chemical synthesis protocols and low cost reductant for synthesizing iron nanoparticles.

## ACKNOWLEDGEMENT

The authors are sincerely thankful to the Directorate of General CIPET, Bhubaneswar, India and to Shri Binod Dash, Chairman, Synergy Institute of Technology for providing facilities to carry out this piece of research work.
