Abstract:
\( \mathbb{S}(\sqrt{k^2m}) \) is the set of all roots of primitive second degree equations \( ct^2+2at+b=0 \), with reduced discriminant \( \Delta = a^2-bc \) equal to \( k^2m \) and \( \mathbb{S}(\sqrt{m}) \) is the disjoint union of \( \mathbb{S}(\sqrt{k^2m}) \), for all \( k \in \mathbb{N} \). The Authors study the action of two hecke groups- the full modular group \( \text{H}(\lambda) = \text{PSL}_2(\mathbb{C}) \) and the group of Möbius transformations \( \text{H}(\sqrt{2}) = \{ x, y : x^2 = y^4 = 1 \} \). The action of \( \text{H}(\lambda_3) = \text{G}, \text{H}(\sqrt{2}) = \text{H}, \text{G} \cap \text{H} \) and their subgroups on different sets of numbers \( \frac{a+\sqrt{n}}{c} \) with fixed discriminants in the quadratic field has discussed for finding orbits.

Key words: Legendre symbol • ambiguous numbers • Möbius transformations • G-set

INTRODUCTION

A non-empty set \( \Omega \) with an action of the group \( G \) on it, is said to be a \( G \)-set. We say that \( \Omega \) is a transitive \( G \)-set if, for any \( p,q \in \Omega \) there exists a \( g \in G \) such that \( pg = q \). Since every element of

\[ \mathbb{S}(\sqrt{m}) \sqcup \{1+w\sqrt{m} : t, 0 \neq w \in \mathbb{N} \} \]

can be expressed uniquely as \( \frac{a+\sqrt{n}}{c} \), where \( n = k^2m \), \( k \) is any positive integer and \( a, \frac{a^2-n}{c} \) and \( c \) are relatively prime integers and we denote it by \( \alpha(a,b,c) \). Then

\[ \mathbb{S}(\sqrt{m}) = \left\{ \frac{a+\sqrt{n}}{c} : a, c, b = \frac{a^2-n}{c} \in \mathbb{Z}, (a,b,c) = 1 \right\} \]

is a proper \( G \)-subset of \( \mathbb{S}(\sqrt{m}) \sqcup \mathbb{S}(\sqrt{2}) \) and since \( \mathbb{S}(\sqrt{n}) \cap \mathbb{S}(\sqrt{2}) = \emptyset \) for distinct \( n,n' \) non-square integers so \( \mathbb{S}(\sqrt{m}) \sqcup \mathbb{S}(\sqrt{2}) \) is the disjoint union of \( \mathbb{S}(\sqrt{k^2m}) \) for all \( k \in \mathbb{N} \). If \( \alpha(a,b,c) \in \mathbb{S}(\sqrt{2}) \) and its conjugate \( \overline{\alpha} \) have opposite signs then \( \alpha \) is called an ambiguous number [1, 2].

In 1936 Erich Hecke [3] introduced the groups \( \text{H}(\lambda) \) generated by two linear-fractional transformations

\[ x(z) = \frac{-1}{z} \quad \text{and} \quad y(z) = \frac{-1}{z+\lambda} \]

Hecke showed that \( \text{H}(\lambda) \) is discrete if and only if

\[ \lambda = \lambda_q = 2\cos\left(\frac{\pi}{q}\right), \quad q \in \mathbb{N}, \quad q \geq 3 \text{ or } \lambda \geq 2. \]

Hecke group \( \text{H}(\lambda_q) \) is isomorphic to the free product of two finite cyclic group of order 2 and \( q \) and it has a presentation

\[ \text{H}(\lambda_q) = \langle x, y : x^2 = y^q = 1 \rangle \cong C_2 \ast C_q \]

The first few of these groups are \( \text{H}(\lambda_3) = \text{PSL}_2(\mathbb{C}) \), the modular group,

\[ \text{H}(\lambda_q) = \text{H}(\sqrt{2}) = \{ x, y : x^2 = y^4 = 1 \} \]

where

\[ x(z) = \frac{-1}{2z} \quad \text{and} \quad y(z) = \frac{-1}{2(z+1)} \]

and

\[ \text{H}(\lambda_q) = \text{H}(\sqrt{3}) = \{ x, y : x^2 = y^6 = 1 \} \]

Corresponding Author: M. Aslam Malik, Department of Mathematics, University of the Punjab, Quaid-e-Azam Campus, Lahore-54590, Pakistan
One of the main reasons for $H(\sqrt{2})$ and $H(\sqrt{3})$ to be two of the most important Hecke groups is that part of the modular group, they are the only Hecke groups $H(\lambda)_{q}$ whose elements can be completely described. It has been shown [4, 5] that the action of the full modular group $G = \langle x, y : x^{2} = y^{3} = 1 \rangle$, where $x(z) = -1/2z$ and $y(z) = -1/z + 1$, (respectively $H = \langle x, y : x^{2} = y^{4} = 1 \rangle$, where $x(z) = -1/2z$ and $y(z) = -1/(2z + 1)$) on the rational projective line $\mathbb{P} \cup \{\infty\}$ is transitive. The action of $G$ on $\mathbb{P}(\sqrt{m}) \cup \{\infty\}$ has been discussed in [6, 7]. An action of $H$ and its proper subgroup on $\mathbb{P}(\sqrt{m}) \cup \{\infty\}$ has been discussed in [8-10].

We are concerned with two hecke groups- the full modular group $G = \text{PSL}_{2}(\mathbb{Z})$ and another group of Möbius transformations $H(\lambda)_{q} = H$. Different sets of numbers $\alpha a + bc$ with fixed discriminants in the quadratic field are considered and are looked at different orbits of the action of $G, H, G \cap H$ and their subgroups on these sets. The results of earlier papers on the numbers of orbits and the properties of elements belonging to them are extended by similar results related to the new twist connected to the group $H$ which has nontrivial intersection with $G$ and opens a possibility to look at orbits which were not computed in earlier paper. We consider one of the interesting subgroups of $G \cap H$ is $*H = xy, yx$. In Section 3 we prove that for each $H$-subset $A$ of $\square^{+}(\sqrt{2n})$ or $\square^{+}(\sqrt{3n}) \setminus \square^{+}(\sqrt{2n})$, $A \cup x(A)$ is a $G$-subset of $\square^{+}(\sqrt{2n})$. We also prove that for each $H$-subset $A$ of $\square^{+}(\sqrt{2n})$, $A \cup x(A)$ is an $H$-subset of $\square^{+}(\sqrt{2n})$ or $\square^{-}(\sqrt{2n})$ according as $n \equiv 0(\text{mod } 4)$ or $n \equiv 0(\text{mod } 4)$ similarly if $A$ is an $H$-subset of $\square^{+}(\sqrt{2n}) \setminus \square^{+}(\sqrt{2n})$ then $A \cup x(A)$ is an $H$-subset of $\square^{-}(\sqrt{2n})$ for each non-square $n$. In particular, the partition of $\square^{+}(\sqrt{2n})$ has been discussed depending upon classes $[a, b, c]$ modulo $p_{1}p_{2}$.

**PRELIMINARIES**

We quote from [6-8, 10] the following results for later reference. Also we tabulate the actions on $\alpha a + bc \in \square^{+}(\sqrt{2n})$ of $x, y$ and $x, y$, the generators of $G$ and $H$ respectively in Table 1 and 2.

**Table 1:** The action of elements of $G$ on $\alpha \in \square^{+}(\sqrt{2n})$

**Lemma 2.1:** [8] Let $\alpha a + bc \in \square^{+}(\sqrt{2n})$. Then:

1. If $n \equiv 0(\text{mod } 4)$ then $\alpha \equiv \frac{2}{2} \in \square^{+}(\sqrt{2n})$ if and only if $2|b$.
2. $\frac{\alpha}{2} \in \square^{+}(\sqrt{4n})$ if and only if $2|b$.

**Theorem 2.2:** [8] The set

$$\square^{+}(\sqrt{n}) = \left\{ \frac{\alpha}{t} : \alpha \in \square^{+}(\sqrt{2n}), t=1,2 \right\}$$

is invariant under the action of $H$.

**Theorem 2.3:** [8] For each non square positive integer $n \equiv 1, 2$ or $3(\text{mod } 4)$, $\square^{+}(\sqrt{n}) = \left\{ \alpha \in \square^{+}(\sqrt{2n}) : 2|c \right\}$ is an $H$-subset of $\square^{+}(\sqrt{2n})$.

**Theorem 2.4:** [6] If $n \equiv 0$ or $3(\text{mod } 4)$, then

$$S = \left\{ \alpha \in \square^{+}(\sqrt{2n}) : b \text{ or } c \equiv 1(\text{mod } 4) \right\}$$
and
\[ S = \{ (n): b \text{ or } c \equiv -1 \text{ (mod } 4) \} \]

are exactly two disjoint G-subsets of \( G^*(\sqrt{n}) \) depending upon classes \([a, b, c]\) modulo 4.

**Theorem 2.5:** [6] If \( n \equiv 1 \text{(mod } 4) \), then \( G^*(\sqrt{n}) = \{ (n): b \text{ or } c \equiv -1 \text{ (mod } 8) \} \) and \( G^*(\sqrt{n}) \) are both G-subsets of \( G^*(\sqrt{n}) \).

**Theorem 2.6:** [10] Let \( n \equiv 2 \text{(mod } 8), n \neq 2 \). Then
\[ B^1 = \{ (n): b \text{ or } c \equiv 1 \text{ (mod } 8) \} \]
and
\[ B^2 = \{ (n): b \text{ or } c \equiv 3 \text{ (mod } 8) \} \]
are both G-subsets of \( G^*(\sqrt{n}) \).

**Theorem 2.7:** [10] Let \( n \equiv 6 \text{(mod } 8) \). Then
\[ B = \{ (n): b \text{ or } c \equiv 1 \text{ or } 3 \text{ (mod } 8) \} \]
and
\[ B = \{ (n): b \text{ or } c \equiv -1 \text{ or } -3 \text{ (mod } 8) \} \]
are both G-subsets of \( G^*(\sqrt{n}) \).

**Theorem 2.8:** [7] Let \( p \) be an odd prime factor of \( n \). Then both of
\[ S_p^1 = \{ (n): b \text{ or } c \equiv 1 \text{ (mod } p) \} \]
and
\[ S_p^2 = \{ (n): b \text{ or } c \equiv -1 \text{ (mod } p) \} \]
are G-subsets of \( G^*(\sqrt{n}) \). In particular, these are the only G-subsets of \( G^*(\sqrt{n}) \) depending upon classes \([a, b, c]\) modulo \( p \).

**ACTION OF \( \text{PSL}_2(\mathbb{C}) \cap H(\sqrt{2}) \) ON \( G^*(\sqrt{n}) \)**

We start this section by recalling that
\[ G = \{ x^y: x^2 = y^3 = 1 \}, \quad H = \{ x, y: x^2 = y^4 = 1 \} \]
where \( x^y = x \alpha, \quad y^x = x \alpha, \quad x(\alpha) = \frac{-1}{\alpha} \)
and
\[ y(\alpha) = \frac{-1}{2(\alpha + 1)} \]

The proper subset \( G^*(\sqrt{n}) \) of \( G^*(\sqrt{n}) \) is invariant under the action of modular group \( G \) but \( G^*(\sqrt{n}) \) is not invariant under the mobious group \( H \). Thus it motivates us to establish a connection between the elements of the groups \( G \) and \( H \) and hence to deduce a common subgroup \( H^* = \{ x, y \} \) of both groups such that each of \( G^*(\sqrt{n}) \) and \( G^*(\sqrt{n}) \) is invariant under \( H^* \) and hence we find G-subsets of \( G^*(\sqrt{n}) \) and H-subsets of \( G^*(\sqrt{n}) \), \( G^*(\sqrt{n}) \) according as \( n \equiv 0 \text{ (mod } 4) \) or \( n \equiv 0 \text{ (mod } 4) \) and \( G^*(\sqrt{n}) \) for all non-square \( n \).

For this we need the following crucial results which show the relationships between the elements of \( G \) and \( H \).

**Lemma 3.1** Let \( x, y \) be the generators of \( G \) and \( H \) respectively defined above. Then we have:
1. \( y^2 = (x^y x)(y^x) \) and \( y^3 = \frac{1}{2} x (y^x)^3 x^y \).
2. \( x = y x y \) and \( y_2 = (y^x)^2 \).
3. \( y_2 x = \frac{1}{2} (x(y^x)^2)(y^x) \) and \( x = \frac{1}{2} (y^x)(y^x) \).
4. \( x = 2 y \) and \( y = (2 y)(2 y)(2 y) \).
5. \( x \cdot x = 2 x \) and \( y \cdot y = 2(x)(2 y)(2 x) \).

Following corollaries are immediate consequences of Lemma 3.1.

**Corollaries 3.2**
1. By Lemma 3.1, since \( x = y x \) and \( y = (x^y)^2 \) so \( H^* = \{ x, y \} \) is a common subgroup of \( G \) and \( H \) where \( x, y \) are the transformations defined by \( x(\alpha) = \alpha + 1 \) and \( y(x(\alpha)) = \frac{1}{1 + 2 x(\alpha)} \).
2. As \( y x x y y x = y^2 \) so \( \langle y^2, x y x \rangle \) is a proper subgroup of \( H^* \).
3. \( \langle H^*, x \rangle = \langle H^*, y \rangle = H \) and \( \langle H^*, x \rangle = \langle H^*, y \rangle = G \).

Since for each integer \( n \), either \((n/p) = 0 \) or \((n/p) = \pm 1 \) for each odd prime \( p \). So in the following lemma we classify the elements of \( G^*(\sqrt{n}) \) in terms of classes \([a, b, c]\) modulo \( p \) with 0 modulo \( p \) or \( q \), \( qr \) nature of \( a, b \) and \( c \) modulo \( p \).
Lemma 3.3: Let \( p \) be prime and \( n \equiv 0 \pmod{p} \). Then \( E_p^0 \) consists of classes \([0, 0, QR], [0, 0, QR, 0], [0, QR, 0], [0, QR, 0, QR], [QR, QR, 0], [QR, QR, QR] \). Therefore \( p \equiv 1 \pmod{4} \) gives \([QR, QR, QR], [QR, QR, QR], [QNR, QNR, QR] \) and if \( p \equiv 3 \pmod{4} \), then we have \([QNR, QNR, QNR], [QNR, QNR, QR] \) or \([QR, QR, QNR] \).

**Proof:** Let \([a,b,c](\pmod{p})\) be any class of \( \alpha_{a,b,c} \). Then \( a^2 \equiv bc \pmod{p} \) leads us to exactly three cases. If \( a \equiv 0 \pmod{p} \) then exactly one of \( b, c \) is \( \equiv 0 \pmod{p} \) and the other is \( QR \) or \( QNR \) of \( p \) as otherwise \((a,b,c)\neq 1\) and hence the class \([a,b,c] \) is one of the forms \([0, 0, QR], [0, 0, QNR], [0, QR, 0], [QR, QR, 0], [QR, QR, QR], [QR, QNR, QNR] \). If \((a/p) = 1\) then \((bc/p) = 1\) and the class takes the form \([QR, QR, QR] \) or \([QR, QNR, QNR] \). In the case if \((a/p) = -1\) then \((a^2/p) = 1\) so again \((bc/p) = 1\). This yields the class in the forms \([QR, QR, QR] \) or \([QNR, QNR, QNR] \). Hence the result.

Lemma 3.4: Let \((n/p) = 1\) and let \([a,b,c](\pmod{p})\) be the class of \( \alpha_{a,b,c}(\pmod{p}) \) of \( \mathbb{F}^+(\sqrt{n}) \). Then:

1. If \( p \equiv 1 \pmod{4} \) then \([a,b,c](\pmod{p})\) has the forms \([0, QR, QR], [0, QR, QNR], [QR, 0, QR], [QR, 0, QNR], [QR, QR, 0], [QR, QNR, 0], [QNR, QR, 0], [QNR, QNR, 0] \). If \((a/p) = 1 \) then \((bc/p) = 1\) and the class takes the form \([QR, QR, QR] \) or \([QR, QNR, QNR] \). In the case if \((a/p) = -1\) then \((a^2/p) = 1\) so again \((bc/p) = 1\). This yields the class in the forms \([QR, QR, QR] \) or \([QNR, QNR, QNR] \).

2. If \( p \equiv 3 \pmod{4} \) then \([a,b,c](\pmod{p})\) has the forms \([0, QR, QR], [0, QR, QNR], [QR, 0, QR], [QR, 0, QNR], [QR, QR, 0], [QR, QNR, 0], [QNR, QR, 0], [QNR, QNR, 0] \). If \((a/p) = \pm 1\) then \((a^2/p) = 1\) so again \((bc/p) = 1\). This yields the class in the forms \([QR, QR, QR] \) or \([QNR, QNR, QNR] \).

**Proof:** Let \([a,b,c](\pmod{p})\) be the class of \( \alpha_{a,b,c} \) with \( a^2 - n = bc \). As \((n/p) = 1\) so if \((a/p) = 0\) then \((a^2/p) = \pm 1\) according as \( p \equiv 1 \pmod{4} \) or \( p \equiv 3 \pmod{4} \). Thus we have \([0, QR, QR], [0, QR, QNR], [QR, QR, 0], [QR, QNR, 0] \) only. This completes the proof.

Lemma 3.5 Let \((n/p) = -1\) and let \([a,b,c](\pmod{p})\) be the class of \( \alpha_{a,b,c}(\pmod{p}) \) of \( \mathbb{F}^+(\sqrt{n}) \). Then:

1. If \( p = 1 \pmod{4} \) then \([a,b,c](\pmod{p})\) has the forms \([0, QR, QR], [0, QR, QNR], [QR, 0, QR], [QR, 0, QNR], [QR, QR, 0], [QR, QNR, 0], [QNR, QR, 0], [QNR, QNR, 0] \).

2. If \( p = 3 \pmod{4} \) then \([a,b,c](\pmod{p})\) has the forms \([0, QR, QR], [0, QR, QNR], [QR, 0, QR], [QR, 0, QNR], [QR, QR, 0], [QR, QNR, 0], [QNR, QR, 0], [QNR, QNR, 0] \) or \([QR, 0, 0] \) only. This completes the proof.

**Proof:** Let \([a,b,c](\pmod{p})\) be any class of \( \alpha_{a,b,c} \) with \( a^2 - n = bc \). As \((n/p) = -1\) so if \((a/p) = 0\) then \((a^2/p) = \pm 1\) according as \( p \equiv 1 \pmod{4} \) or \( p \equiv 3 \pmod{4} \). Thus we have \([0, QR, QR], [0, QR, QNR], [QR, QR, 0], [QR, QNR, 0] \) or \([QR, 0, 0] \) only. If \((a/p) = \pm 1\) then \((a^2/p) = \pm 1\).

Lemma 3.6: \( \mathbb{F}''(\sqrt{n}) \) and \( \mathbb{F}''(\sqrt{n}) \setminus \mathbb{F}''(\sqrt{n}) \) are two distinct \( H^* \)-subsets of \( \mathbb{F}''(\sqrt{n}) \) depending upon classes \([a,b,c] \) modulo 2. Theorem 3.7 and Remarks 3.8 are extension of Lemma 3.6 and discuss the action of \( H^* \) on \( \mathbb{F}''(\sqrt{n}) \) depending upon classes \([a,b,c] \) modulo 4.

**Note:** If \((n/2) = 0\) then \([1,1,1],[0,0,1] \) and \([0,1,0] \) are three classes of \( \mathbb{F}''(\sqrt{n}) \) modulo \( 2 \) and \( n \) is an odd then three classes of \( \mathbb{F}''(\sqrt{n}) \) are \([1,0,1],[1,1,0] \) and \([0,1,0] \) modulo \( 2 \). These are the only classes of \( \mathbb{F}''(\sqrt{n}) \) if \( n \equiv 3 \pmod{4} \). But if \( n \equiv 1 \pmod{4} \) then \([1,0,0] \) is also a class of \( \mathbb{F}''(\sqrt{n}) \) and there are no further classes. These classes in modulo \( 2 \) of \( \mathbb{F}''(\sqrt{n}) \) do not give any useful information during the study of action of \( G \) on \( \mathbb{F}''(\sqrt{n}) \) except that if \( n \equiv 1 \pmod{4} \) then the set consisting of all elements of \( \mathbb{F}''(\sqrt{n}) \) of the form \([1,0,0] \) is invariant under the action of the group \( G \). Whereas the study of action of \( H^* \) on \( \mathbb{F}''(\sqrt{n}) \) gives some useful information about these classes. The following crucial result determines the \( H^* \)-subsets of \( \mathbb{F}''(\sqrt{n}) \) depending upon classes \([a,b,c] \) modulo \( 2 \). It is interesting to observe that \( \mathbb{F}''(\sqrt{n}) \) splits into \( \mathbb{F}''(\sqrt{n}) \) and \( \mathbb{F}''(\sqrt{n}) \setminus \mathbb{F}''(\sqrt{n}) \) modulo \( 2 \). Each of these two \( H^* \)-subsets further splits into proper \( H^* \)-subsets in modulo \( 4 \).

Lemma 3.7: Let \( n \) be any non-square positive integer. Then \( \mathbb{F}''(\sqrt{n}) \) splits into two proper \( H^* \)-subsets

\[
A_1 = \{a \in \mathbb{F}''(\sqrt{n}) \setminus \mathbb{F}''(\sqrt{n}) : c \equiv 1(\pmod{4})\}
\]

\[
A_2 = \{a \in \mathbb{F}''(\sqrt{n}) \setminus \mathbb{F}''(\sqrt{n}) : c \equiv 3(\pmod{4})\}
\]

Similarly \( \mathbb{F}''(\sqrt{n}) \) splits into two proper \( H^* \)-subsets.
\[ B_1 = \{ \alpha \in \square^* (\sqrt{n}) : c \equiv 0(\text{mod} \ 4) \} \]
and
\[ B_2 = \{ \alpha \in \square^* (\sqrt{n}) : c \equiv 2(\text{mod} \ 4) \} \]

**Remarks 3.8**

1. Let \( n \equiv 1 \) (mod 4). Then
\[ \square^* (\sqrt{n}) = \{ \alpha \in \square^* (\sqrt{n}) : 2|b, c \} \]
and
\[ \square^* (\sqrt{n}) \cap \square^* (\sqrt{n}) \]
are \( H^* \)-subsets of \( \square^* (\sqrt{n}) \).

In particular if \( n \equiv 5 \) (mod 8), then
\[ B_1 = \square^* (\sqrt{n}) \cap \square^* (\sqrt{n}) \]
and
\[ B_2 = \square^* (\sqrt{n}) \cap \square^* (\sqrt{n}) \]
are \( H^* \)-subsets of \( \square^* (\sqrt{n}) \). Whereas if \( n \equiv 1 \) (mod 8), then
\[ C_1 = \{ \alpha \in \square^* (\sqrt{n}) \cap B_1 : a \equiv 1(\text{mod} \ 4) \} \]
\[ C_2 = \{ \alpha \in \square^* (\sqrt{n}) \cap B_1 : a \equiv 3(\text{mod} \ 4) \} \]
and
\[ C_3 = \{ \alpha \in \square^* (\sqrt{n}) : c \equiv 2(\text{mod} \ 4) \} \]
are \( H^* \)-subsets of \( \square^* (\sqrt{n}) \). Specifically, \( B_3 = C_1 \cup C_2 \cup C_4 \), \( B_2 = C_3 \).

3. As we know that if \( n \) and \( c \) are even, then a must be even as \( (a, b, c) = 1 \). If \( n \equiv 2 \) (mod 4), then \( B_2 = \square^* (\sqrt{n}) \) and \( B_1 = \emptyset \).

4. If \( n \equiv 0 \) or \( 3 \) (mod 4), then \( B_2 \) or \( B_3 \) is empty according as \( n \equiv 0 \) or \( 3 \) (mod 4). As we know that if \( n \) and \( c \) are even, then a must be even as \( (a, b, c) = 1 \). However \( D_1 = \{ \alpha \in \square^* (\sqrt{n}) : b \equiv 1(\text{mod} \ 4) \} \), \( D_2 = \{ \alpha \in \square^* (\sqrt{n}) : b \equiv 3(\text{mod} \ 4) \} \) are proper \( H^* \)-subsets of \( \square^* (\sqrt{n}) \) depending upon classes \( [a, b, c] \) modulo 4.

**Lemma 3.9:** Let \( n \) be any non-square positive integer. Then \( \square^* (\sqrt{4n}) \) and \( \square^* (\sqrt{n}) \cap \square^* (\sqrt{n}) \) are distinct \( H^* \)-subsets of \( \square^* (\sqrt{n}) \).

\[ \square^* (\sqrt{4n}) = \square^* (\sqrt{n}) \cup \square^* (\sqrt{n}) \]

**Proof:** Follows by the equations
\[ x(\square^* (\sqrt{n}) \cap \square^* (\sqrt{n})) = \square^* (\sqrt{4n}) \] and vice versa. Hence
\[ \square^* (\sqrt{n}) \cap \square^* (\sqrt{n}) \]
is equivalent to \( \square^* (\sqrt{4n}) \).

Clearly
\[ \square^* (\sqrt{n}) \cup \square^* (\sqrt{4n}) = \square^* (\sqrt{4n}) \]
where \( \square^* (\sqrt{n}) \) denotes the set of all ambiguous numbers in \( \square^* (\sqrt{n}) \) [2].

**Remark 3.10**

(i) Each G-subset \( X \) of \( \square^* (\sqrt{n}) \) splits into two \( H^* \)-subsets \( X \cap \square^* (\sqrt{n}) \) and \( X \cap \square^* (\sqrt{n}) \) and
\[ X(\square^* (\sqrt{n}) \cap \square^* (\sqrt{n})) = X \]

(ii) Each H-subset \( Y \) of \( \square^* (\sqrt{n}) \) splits into two \( H^* \)-subsets \( Y \cap \square^* (\sqrt{n}) \) and \( Y \cap \square^* (\sqrt{n}) \).

(iii) Each H-subset \( Y \) of \( \square^* (\sqrt{n}) \), \( n \equiv 0 \) (mod 4) splits into two \( H^* \)-subsets \( Y \cap \square^* (\sqrt{n}) \) and \( Y \cap \square^* (\sqrt{n}) \).

(iv) Each H-subset \( Y \) of \( \square^* (\sqrt{n}) \), \( n \equiv 0 \) (mod 4) splits into two \( H^* \)-subsets \( Y \cap \square^* (\sqrt{n}) \) and \( Y \cap \square^* (\sqrt{n}) \).

**Theorem 3.11**

(a) If \( A \) is an \( H^* \)-subset of \( \square^* (\sqrt{n}) \) or \( \square^* (\sqrt{n}) \), then \( A \cap X(A) \) is a G-subset of \( \square^* (\sqrt{n}) \).

(b) If \( A \) is an \( H^* \)-subset of \( \square^* (\sqrt{n}) \), then \( A \cup X(A) \) is an \( H \)-subset of \( \square^* (\sqrt{n}) \) or \( \square^* (\sqrt{n}) \) according as \( n \approx \) (mod 4) or \( n \equiv 0 \) (mod 4).

(c) If \( A \) is an \( H \)-subset of \( \square^* (\sqrt{n}) \), \( n \not\equiv 0 \) (mod 4) splits into two \( H^* \)-subsets \( Y \cap \square^* (\sqrt{n}) \) and \( Y \cap \square^* (\sqrt{n}) \).

**Proof:** Proof of (a) follows by the equation
\[ x(\square^* (\sqrt{n}) \cap \square^* (\sqrt{n})) = \square^* (\sqrt{n}) \]
Proof of (b) follows by the equations
\[ x(\square^* (\sqrt{n}) \cap \square^* (\sqrt{n})) = \square^* (\sqrt{n}) \] or \( x \cap \square^* (\sqrt{n}) \) as \( \left\{ \begin{array}{ll} \sqrt{n} & \text{if } n \equiv 0 \text{ (mod 4)} \\ \sqrt{n} & \text{if } n \equiv 0 \text{ (mod 4)} \\ \end{array} \right. \)
and vice versa. Hence
\[ x(\square^* (\sqrt{n}) \cap \square^* (\sqrt{n})) = \square^* (\sqrt{n}) \]

Proof of (c) follows by the equation
\[ x(\square^* (\sqrt{n}) \cap \square^* (\sqrt{n})) = \square^* (\sqrt{n}) \]
Following examples illustrate the above results.

**Examples 3.12**

1. Let $n = 8$. Then

$$\alpha = \frac{1+\sqrt{8}}{4} \in \mathbb{Z}^* (\sqrt{8})$$

but

$$\alpha = \frac{1+\sqrt{8}}{2} = \frac{2+\sqrt{32}}{4} \in \mathbb{Z}^* (\sqrt{32})$$

Also

$$\beta = \frac{2+\sqrt{8}}{4} \in \mathbb{Z}^* (\sqrt{8})$$

but

$$\beta = \frac{1+\sqrt{2}}{4} \in \mathbb{Z}^* (\sqrt{2})$$

Similarly

$$\gamma = \frac{2+\sqrt{8}}{4} \in \mathbb{Z}^* (\sqrt{8})$$

whereas

$$\gamma = \frac{4+\sqrt{32}}{16} \in \mathbb{Z}^* (\sqrt{32})$$

Also

$$\mathbb{Z}^* (\sqrt{8}) = (\sqrt{8})^H \cup (-\sqrt{8})^H$$

$$\mathbb{Z}^* (\sqrt{32}) = (\sqrt{32})^H \cup (-\sqrt{32})^H$$

So $\mathbb{Z}^* (\sqrt{8})$ has exactly 4 orbits under the action of $H$ whereas $\mathbb{Z}^* (\sqrt{37})$ splits into two $G$-orbits namely $(\sqrt{37})^H$, $(-\sqrt{37})^H$.

2. $\mathbb{Z}^* (\sqrt{37})$ splits into nine $H$-orbits. Also

$$\mathbb{Z}^* (\sqrt{48}) = (\sqrt{48})^H \cup (\sqrt{37})^H \cup (\sqrt{37})^H$$

$$\cup (\sqrt{48})^H \cup (-\sqrt{37})^H \cup (-\sqrt{37})^H$$

and

$$\mathbb{Z}^* (\sqrt{37}) = (\frac{1+\sqrt{37}}{2})^H \cup (\frac{1+\sqrt{37}}{4})^H \cup (-\frac{1+\sqrt{37}}{4})^H \cup (-\frac{1+\sqrt{37}}{4})^H$$

whereas $\mathbb{Z}^* (\sqrt{37})$ splits into four $G$-orbits namely $(\sqrt{37})^G$

$$\begin{align*}
\frac{1+\sqrt{37}}{2}^G &\quad \frac{1+\sqrt{37}}{4}^G \\
\frac{1+\sqrt{37}}{3}^G &\quad \frac{1+\sqrt{37}}{4}^G
\end{align*}$$

In [7] it was proved that $S_1^p$, $S_2^p$ are $G$-subsets of $\mathbb{Z}^* (\sqrt{n})$ for each odd prime factor of $n$. We now study the action of $H^*$ on $\mathbb{Z}^* (\sqrt{n})$.

**Theorem 3.13:** Let $p$ be an odd prime factor of $n$. Then

$$S_1^p = \{ \alpha \in \mathbb{Z}^* (\sqrt{n}): (b/p) = 1 \}$$

and

$$S_2^p = \{ \alpha \in \mathbb{Z}^* (\sqrt{n}): (c/p) = 1 \}$$

are two $H^*$-subsets of $\mathbb{Z}^* (\sqrt{n})$. In particular, these are the only $H^*$-subsets of $\mathbb{Z}^* (\sqrt{n})$ depending upon classes $[a,b,c]$ modulo $p$.

**Proof:** Let $[a,b,c]$(mod $p$) be the class of $\alpha(a,b,c) \in \mathbb{Z}^* (\sqrt{n})$. In view of Lemma 3.3, either both of $b,c$ are qrs or qns and the two equations

$$xy(\alpha(a,b,c)) = \alpha'(a + c, 2a + b + c, c)$$

$$yx(\alpha(a,b,c)) = \alpha'(a - 2b, b, -4a + 4b + c)$$

fix $b,c$ modulo $p$. If $a \equiv b \equiv 0$(mod $p$) then $((2a+b+c)/p) = 1$ or $((2a+b+c)/p) = -1$ according as $(c/p) = 1$ or
\((c/p) = -1\). similarly for \(a \equiv c \equiv 0 \pmod{p}\). This shows that the sets \(\text{S}_1^p\) and \(\text{S}_2^p\) are \(H\)-subsets of \(\sqrt[n]{c/p}\) depending upon classes modulo \(p\).

The following corollary is an immediate consequence of Lemma 3.6 and Theorem 3.13.

**Corollary 3.14:** Let \(p\) be an odd prime such that \(n \equiv 0 \pmod{2p}\). Then \(\sqrt[n]{c/p}\) splits into four proper \(H\)-subsets depending upon classes modulo \(2p\).

**Proof:** Since \(n^2 \equiv bc \pmod{p}\) implies that \(n^2 \equiv bc \pmod{p}\), This is equivalent to congruences \(n^2 \equiv bc \pmod{p}\) and \(n^2 \equiv bc \pmod{p}\). By Theorem 3.13 \(\text{S}_1^p, \text{S}_2^p\) are \(H\)-subsets and then, by Lemma 3.6, each of \(\text{S}_1^p\) and \(\text{S}_2^p\) further splits into two \(H\)-subsets \(\text{S}_1^p \cap \sqrt[n]{c/p}, \text{S}_2^p \cap \sqrt[n]{c/p}\), \(\text{S}_1^p \setminus \sqrt[n]{c/p}\) and \(\text{S}_2^p \setminus \sqrt[n]{c/p}\).

The next theorem is more interesting in a sense that whenever \((n/p) = \pm 1\), \(\sqrt[n]{c/p}\) is itself an \(H\)-set depending upon classes \([a,b,c]\) modulo \(p\).

**Theorem 3.15:** Let \(p\) be an odd prime and \((n/p) = \pm 1\). Then \(\sqrt[n]{c/p}\) is itself an \(H\)-set depending upon classes \([a,b,c]\) modulo \(p\).

**Proof:** follows from Lemmas 3.4, 3.5 and the equations \(xy(x) = x + 1\) and \(yx(x) = -\frac{1}{1-2x} \), given in Table 2.

Let us illustrate the above theorem in view of Theorem 3.4. If \((n/3) = 1\), then the subset \([0,1,2], [0,2,1], [1,0,1], [1,1,0], [2,0,2], [2,0,1], [2,1,0], [2,2,0], [1,2,0], [1,0,2], [1,0,0], [2,0,0]\) is an \(H\)-set. That is, \(\sqrt[n]{c/p}\) is itself an \(H\)-set depending upon classes \([a,b,c]\) for each \(n/(3) = -1\).

**Theorem 3.16:** Let \(p\) be an odd prime and \(n\) be a quadratic residue (quadratic non-residue) of \(2p\). Then \(\sqrt[n]{c/p}\) is the disjoint union of three \(H\)-subsets \(\sqrt[n]{c/p}\), \(\sqrt[n]{c/p}\), \(\sqrt[n]{c/p}\), and \(\sqrt[n]{c/p}\), depending upon classes \([a,b,c]\) modulo \(2p\).

**Proof:** follows from Theorems 2.2, 2.3 and 3.15.

The following example justifies the above result.

**Example 3.17:** Since \(17 = 5 \pmod{6}\), then \(\sqrt[n]{c/p}\) splits into these three \(H\)-subsets \([0,1,1], [1,2,1], [2,5,1], [3,4,1], [4,5,1], [5,2,1], [0,5,5], [5,4,5], [4,1,5], [3,2,5], [2,1,5], [1,4,5]\) \([1,1,2], [3,5,2], [5,1,2], [3,1,4], [1,5,4], [5,5,4], [1,2,4], [5,2,4], [3,4,4], [1,4,2], [3,2,2], [5,4,2]\)

The next theorem is a generalization of Theorem 3.13 to the case when \(n\) involves two distinct prime factors.

**Theorem 3.20:** Let \(p_1\) and \(p_2\) be distinct odd primes factors of \(n\). Then \(\text{S}_1^p = \text{S}_1^{p_1} \cap \text{S}_1^{p_2}, \text{S}_2 = \text{S}_1^{p_1} \cap \text{S}_2^{p_2}, \text{S}_3 = \text{S}_2^{p_1} \cap \text{S}_1^{p_2}\) and \(\text{S}_4 = \text{S}_2^{p_1} \cap \text{S}_2^{p_2}\) are four \(H\)-subsets of \(\sqrt[n]{c/p}\). More precisely these are the only \(H\)-subsets of \(\sqrt[n]{c/p}\) depending upon classes \([a,b,c]\) modulo \(p_1, p_2\).

**Proof:** Let \([a,b,c] \equiv \sqrt[n]{c/p}\) be any class of \([a,b,c] \equiv \sqrt[n]{c/p}\) with \(n \equiv 0 \pmod{p_1, p_2}\). Then \(a^2 - n = bc\) implies that

\[
a^2 = bc \pmod{pp_2}
\]

This is equivalent to congruences \(a^2 \equiv bc \pmod{p_1}\) and \(a^2 \equiv bc \pmod{p_2}\). By Theorem 3.14, the congruence \(a^2 \equiv bc \pmod{p_1}\) gives two \(H\)-subsets

\[
\text{S}_1^{p_1} = \{x(a) \in \sqrt[n]{c/p} : (c/p_1) = 1\}
\]

and

\[
\text{S}_2^{p_1} = \{x(a) \in \sqrt[n]{c/p} : (c/p_1) = -1\}
\]

of \(\sqrt[n]{c/p}\). As \(a^2 \equiv bc \pmod{p_2}\), again applying Theorem 3.13 on each of \(\text{S}_1^{p_1}\) and \(\text{S}_2^{p_1}\) we have four \(H\)-subsets \(\text{S}_1, \text{S}_2, \text{S}_3, \text{S}_4\) of \(\sqrt[n]{c/p}\).

**CONCLUSION**

We studied the action of \(H^* = \{xy, yx\}\) on different sets of numbers \(\sqrt[n]{c/p}\) with fixed discriminants in the quadratic field and proved that for each \(H\)-subset \(A\) of \(\sqrt[n]{c/p}\) or \(\sqrt[n]{c/p}\), \(A \cup x(A)\) is a \(G\)-subset of \(\sqrt[n]{c/p}\). We also verified that for each \(H\)-subset \(A\) of \(\sqrt[n]{c/p}\) or \(\sqrt[n]{c/p}\), \(A \cup x(A)\) is an \(H\)-subset of \(\sqrt[n]{c/p}\) or \(\sqrt[n]{c/p}\) depending upon classes modulo \(p_1, p_2\). Similarly if \(A \equiv \sqrt[n]{c/p}\) will be an \(H\)-subset of \(\sqrt[n]{c/p}\) for each
non-square $n$. In particular, if $p_1$ and $p_2$ are distinct odd primes factors of $n$, then we found four $H^*$-subset of $\mathbb{U}^*(\sqrt{n})$ depending upon classes [a,b,c] modulo $p_1p_2$.

REFERENCES
