

Investigation and Numerical Analysis of Building Products Exports to the World

H.R. Sharifighaehsari and M. Alizadehnozari

Department of Engineering, Neka Branch, Islamic Azad University, Neka, Iran

Abstract: Use of the appropriate category in the data collected in the investigation is very important and allows analysts and users to have a clear and rational picture, in the structure review presented. Tables using all goods and services dependent on exports to countries in the outside world and its image can be concluded. Therefore, using the techniques in using these tables an optimization can be reached for export-related activities in relation to the profiles of exporting countries, considering that no human actions are hundred percent efficient. Hence, the optimum use and prevention of waste facilities is something of fundamental importance in this point, which further finds that the issue of increasing exports and the increasing proportion of the population and increase in the quality impact in terms of economic and civil exchanges on other sectors of society, are all discussed. In this paper, we use statistics to analyze the intended exports.

Key words: Exports • Numerical analysis • Building products • World advantage affiliation • Development

INTRODUCTION

One of the topics required for planning and equipment management-related activities are the knowledge of the country's relative advantages in the production equipment and services related to modern equipment. However, most of the comparative advantage is not static and always an advantage, but time is changing with the progress of the knowledge of the relative advantages that are important when developing new equipment, which utilizes international standards and, as a development strategy, should be on the agenda. In order to optimize functional fitness equipment and services, select the appropriate template according to a Yi acceptable model for applying methods and optimal policies is so desirable in terms of national economy and the continued existence and sustainable development and survival and guarantee of movement. In this context determination of the various contributions and service, export countries in the basket according to its long-term possibilities are considered. The correct and timely use of exports and related activities not only ensures the continuation of life and sustainable development in economic and community development as a science but also survival of public service and professional society for future generations will be guaranteed [1-4].

Garlic Exports and Import Substitution Development History: In the decades from 1950 to 1970 AD, are the years following the implementation of ideas and support

of the growth models, which rely on the import substitution. Strategies in 1980 to recommend restructuring the major component of reducing trade barriers and liberalizing foreign trade were made up by economists based on some works, there is trade liberalization strategy for developing countries [1-2]. The export growth, the impact of changes in external pressure on the domestic economy to increase production and reduce capital goods and ultimately helps towards faster economic growth. Some investigators that increased costs to compete with foreign industrial goods exports decreased also stress it and improving production technology and the causes we finally can express that in the absence of domestic demand growth process is slower than output growth because of the relationship and disability of the production is exported [3-6]. Some works also states that exports from the desired impact on productivity, resource allocation, capacity eventually changed using technology to expedite and facilitate economic growth. A model is used to express the growth of exports, with the importance and impact of non-matter had to import growth (although in some cases). Based on other research, stated that the export development of import substitution as a development strategy is the first correlation between economic growth and foreign trade, which was seen in this country [6-10].

Numerical Study of Exports in Iran: No doubt, the theory of general equilibrium and the export of new services and the fundamental theory of a strong country in advance of

Table 1: List of different countries along with beneficiary of exports costs

Table 4: Export advantage cost in different articles

Article type	Percent value	Value (Billion Rials)	Weight (1000 ton)
Member of Islamic conference	47.852	3547	9331
Member of European union	17.991	1334	1084
Member of economy	17.958	1331	1922
Others	34.156	2532	5799

development are considered. Little variation of equipment and services can be exported as concluded from Table 1. In this table, the relations between the export sectors with countries with the most details as possible are shown. From this table we realized that the partner and main beneficiary of exports, for the small country, is the United Arab Emirates. Thus, this small country of Iran's exports, finds the development of spontaneous activities [10-16].

Iran's export advantage, because the cost optimization, a completely among the world's continents can be seen (Table 2).

Move from exporting raw materials and industrial products to the agricultural sector, indicating movement toward the development of the industry proves (Table 3). One of the goals has been a long-term programs.

Considering ruling Iran, the country benefits the common religion in the division, which shall make the maximum use exports (Table 4). Therefore, for Iran, expanding religious belief can be difficult to export products less.

CONCLUSION

In recent years, real exports of developing new equipment and activities associated with the transformation of Iran, which has faced many diverse, low and big products and services and the structure. Allowing access to new technologies, led to changes in export quantities and costs of new activities, which have been associated. Data can be realized for the first stage of export development, the use of advantage a common religion, the second step in the development of distance exports cost less or lower.
