Comparative Analysis of the Vitamin Composition of Two Different Species of Garden Egg (Solanum aethiopicum and Solanum macrocarpon)

C.E. Offor and S.U. Igwe

Department of Biochemistry, Ebonyi State University, Abakaliki, Nigeria

Abstract: The vitamin contents of two species of garden egg, Solanum aethiopicum and Solanum macrocarpon, were determined using spectrophotometric methods. The Solanum aethiopicum recorded higher concentrations of retinol (53.550±0.55), calciferol (0.010±0.00), tocopherol (0.310±0.00), thiamine (0.037±0.00) and riboflavin (0.034±0.00) (in mg/100g) while Solanum macrocarpon contained higher amount of ascorbic acid (2.400±0.00mg/100g). The niacin contents of both species were relatively the same. Solanum aethiopicum could serve a better source of vitamins than Solanum macrocarpon.

Key words: Vitamins · Solanum Aethiopicum and Solanum Macrocarpon

INTRODUCTION

Garden egg, also known as eggplant, is believed to have originated from India, China and other parts of Southeast Asia. The name eggplant or garden egg was used by Europeans in the middle of eighteenth century because the variety they knew had fruits that were the shape and size of goose eggs [1].

Garden egg has different species. There are over 100 species of Solanum which are indigenous to Africa and several of these have been developed as vegetables [2]. It is represented in Nigeria by some 25 species including those domesticated with their leaves, fruits or both eaten as vegetables or used in traditional medicine [3]. Solanum aethiopicum L. (The green-striped garden egg or scarlet egg-plant) has fruits that are round-shaped, striped with green. Solanum macrocarpon L. (Gboma eggplant) originated from Asia. The fruits are oval, white-green stripped and bigger than Solanum aethiopicum [4].

The name vitamin arose initially from what was thought to be the need we have for certain vital chemical compounds-amines. However, it was later discovered that these chemical vital-amines were not all amines. Again it was realized that each vitamin is necessary for us and that we can obtain the vitamins from foods. A well balanced diet of natural foods generally provides the vitamin requirements of man. The lack of any particular vitamin soon manifests in a nutritional disease (avitaminosis) which is characteristic of that specific vitamin. Moreover, lack of vitamins predisposes very low resistance to diseases [5]. Vitamin is generally classified into two main groups: fat soluble and water soluble vitamins. Fat soluble vitamins are vitamins A (retinol), D(calciferol), E(tocopherol) and K(phylloquinone), while water soluble vitamins are B complex, B (riboflavin), B (niacin), C(ascorbic acid) and B (thiamine). Supplementation of these vitamins is important for the treatment of certain health problems [6].

The work was aimed to determine and compare the vitamin compositions of Solanum aethiopicum and Solanum macrocarpon fruits.

Fig. 2: Solanum macrocarpon [7].
MATERIALS AND METHODS

Materials: Fresh *Solanum aethiopicum* and *Solanum macrocarpon* fruits were procured from Abakaliki main market, Ebonyi State, Nigeria. All chemicals and reagents were of analytical grade.

Methods

**Determination of Vitamin Composition:** The methods of Okwu and Josiah [8] were used.

RESULTS DISCUSSION AND CONCLUSION

Investigation of the vitamin contents of the two species showed that both *Solanum aethiopicum* and *Solanum macrocarpon* contained vitamins such as retinol, thiamine, riboflavin, niacin, ascorbic acid, calciferol and tocopherol (Figs. 3, 4 and 5). These vitamins are required for proper development and health. The presence of these vitamins supports the use of garden egg as a food delicacy in different parts of the world [9, 10, 11].

*Solanum aethiopicum* recorded higher level of retinol, calciferol, tocopherol, thiamine and riboflavin than *Solanum macrocarpon* while *Solanum macrocarpon* had higher level of ascorbic acid (Figs. 3, 4 and 5). Achikanu et al. [12] reported that *Solanum aethiopicum* has higher concentrations of most of the vitamins than *Solanum macrocarpon*.

*Solanum aethiopicum* and *Solanum macrocarpon* fruits contained relatively very high levels of retinol (Fig. 3). This could reconcile the study on the use of garden egg for the treatment of glaucoma as suggested by Akuyili et al. [11]. Retinol is important for normal vision, gene expression, growth and immune function by its maintenance of epithelial cell functions Lukaski, [4].

In conclusion, *Solanum aethiopicum* fruits could serve a better source of vitamins than *Solanum macrocarpon* fruits.
